Dry granulation the technological term used in the pharmaceutical production of granules. This method can be compared with grinding large pieces of raw materials into granules of a uniform fraction. The principle of wiping raw materials through a metallized stainless mesh is used. Wet Granulation the technological process of the production of granules from powder materials, in which the raw material is moistened with various liquids. The best effect is obtained by moistening with gluing agents. There are models of granulators that simultaneously moisturize and granulate the powder. It is necessary to dry and powder the finished pellets. Granulate a technological term used in the pharmaceutical production of medicines. Spherical particles obtained by granulating powders. Granulate is used for tableting and filling hard gelatin capsules. Granulator type of pharmaceutical equipment used for granulation of powder materials. The task of using a granulator in the formation of spherical strong granules. According to the technological principle of operation, the granulators are divided into two groups: with the moisture of the powder and without humidification.
